

Pure Harvest Release 8d is a new more portable version of PH. All configuration information has been moved into System Variables.

There are major underlying changes but there are no differences in the screens you use.

On the back end all setup information is now in the database so configuration files on the server are not needed. This makes the application more robust and more portable. All you need is the database and the software. No magic files are required on the server.

We have replaced the old Standby server with a new one that supports the latest portable version (Version 8d) of Pure Harvest.
